

**NEW AUTOMATIC NEST 'AVIO L' and 'AVIO L-D'
a new benchmark for the construction of communal nests**

Based on the all galvanized steel SKA Avio nest, which has been proven over more than ten years and in thousands of installations worldwide, the Avio L nest is closed and opened by cables which raise and lower the perforated Astroturf covered floors, at the times selected by the operator.

Eggs are collected on 500mm wide belts and brought into the packing area on the single or double tiers, and onto a table, tables, packer or grader by a choice of various drive unit options, almost all with individual switching and speed variations for each belt, to give optimum control.

The galvanized steel construction and efficient design makes the nests strong, light, hygienic, easy to clean and maintain, very reliable and long lasting.

There is a choice of 450mm or 550mm deep nests, which means that one row of double sided, two tier nests can be used in the widest of buildings generally considered suitable, or in free range units 'walkover' gaps are available for houses with access to the range on only one side
